The Role of Safety-Net Hospitals in Reducing Disparities in Breast Cancer Care

Angelena Crown, MD¹, Kalpana Ramiah, DrPH, MSc², Bruce Siegel, MD, MPH², and Kathie-Ann Joseph, MD, MPH³

¹Breast Surgery, True Family Women's Cancer Center, Swedish Cancer Institute, Seattle, WA; ²America's Essential Hospitals, Washington, DC; ³Department of Surgery, New York University School of Medicine, NYC Health and Hospitals, Bellevue, New York, NY

ABSTRACT Advances in breast cancer screening and systemic therapies have been credited with profound improvements in breast cancer outcomes; indeed, 5-year relative survival rate approaches 91% in the USA (U.S. National Institutes of Health NCI SEER Training Modules, Breast). While breast cancer mortality has been declining, oncologic outcomes have not improved equally among all races and ethnicities. Many factors have been implicated in breast cancer disparities; chief among them is limited access to care which contributes to lower rates of timely screening mammography and, once diagnosed with breast cancer, lower rates of receipt of guideline concordant care (Wu, Lund, Kimmick GG et al. in *J Clin Oncol* 30(2):142–150, 2012). Hospitals with a safety-net mission, such as the essential hospitals, historically have been dedicated to providing high-quality care to all populations and have eagerly embraced the role of caring for the most vulnerable and working to eliminate health disparities. In this article, we review landmark articles that have evaluated the role safety-net hospitals have played in providing equitable breast cancer care including to those patients who face significant social and economic challenges.

BREAST CANCER OUTCOMES AND DISPARITIES

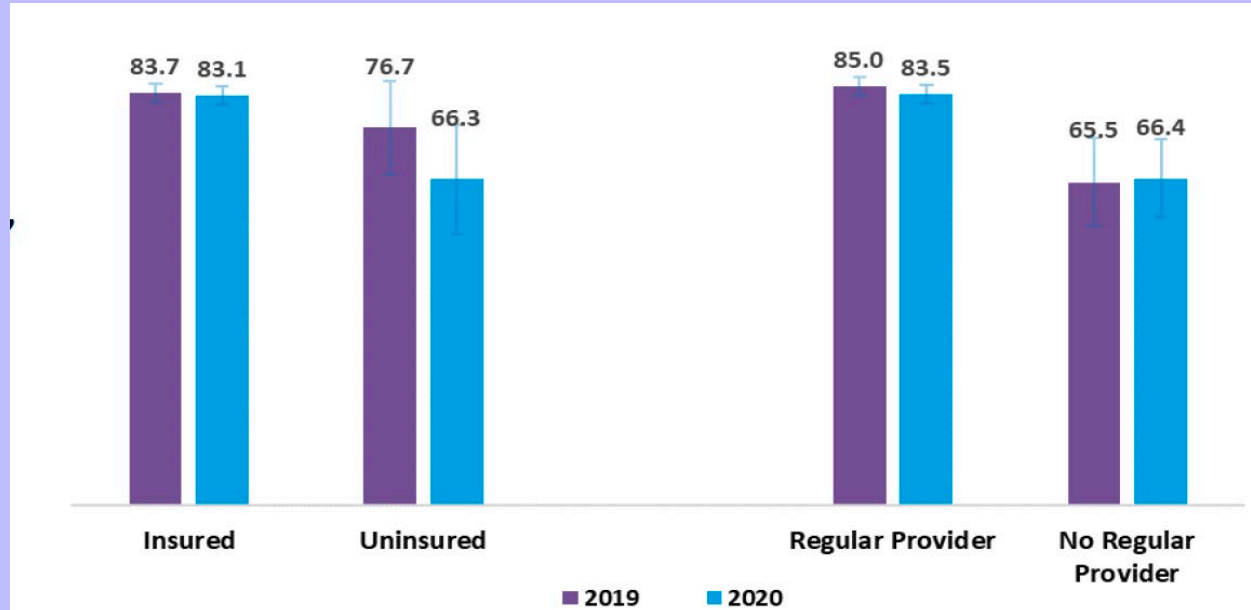

Advances in breast cancer screening and systemic therapies have been credited with profound improvements in breast cancer outcomes. Indeed, the 5-year relative survival rate approaches 91% in the United States.¹ Although breast cancer mortality has been declining, oncologic outcomes have not improved equally among all races and ethnicities.

Many factors have been implicated in breast cancer disparities. Chief among these disparities is limited access to care, which contributes to lower rates of timely screening mammography, and once breast cancer is diagnosed, lower rates of receipt of guideline concordant care.² Hospitals with a safety-net mission, such as the essential hospitals, historically have been dedicated to providing high-quality care to all populations and have eagerly embraced the role of caring for the most vulnerable and working to eliminate health disparities.

HISTORY AND EVOLUTION OF SAFETY-NET HOSPITALS

Since the early 1800s, public hospitals and charity hospitals have been the primary source of care for patients without ready access to care, including the poor, members of marginalized racial and ethnic groups, immigrants, and others. Bellevue Hospital in New York has its roots in the city's 18th-century almshouse dispensaries. The Freedmen's Hospital (today Howard University Hospital), founded in 1862, was created to care for recently emancipated slaves.

Breast Cancer Screening in NYS

Note: Error bars represent 95% confidence intervals.

THE CANCER BURDEN IN NYC

- **20% of adult New Yorkers are uninsured**
- **13.9% or 2.7 million people live below the poverty line**
- **62.5% of New Yorkers over the age of 25 do not have a Bachelor's Degree**
- **12.8% of New Yorkers over the age of 25 do not have a high school diploma**

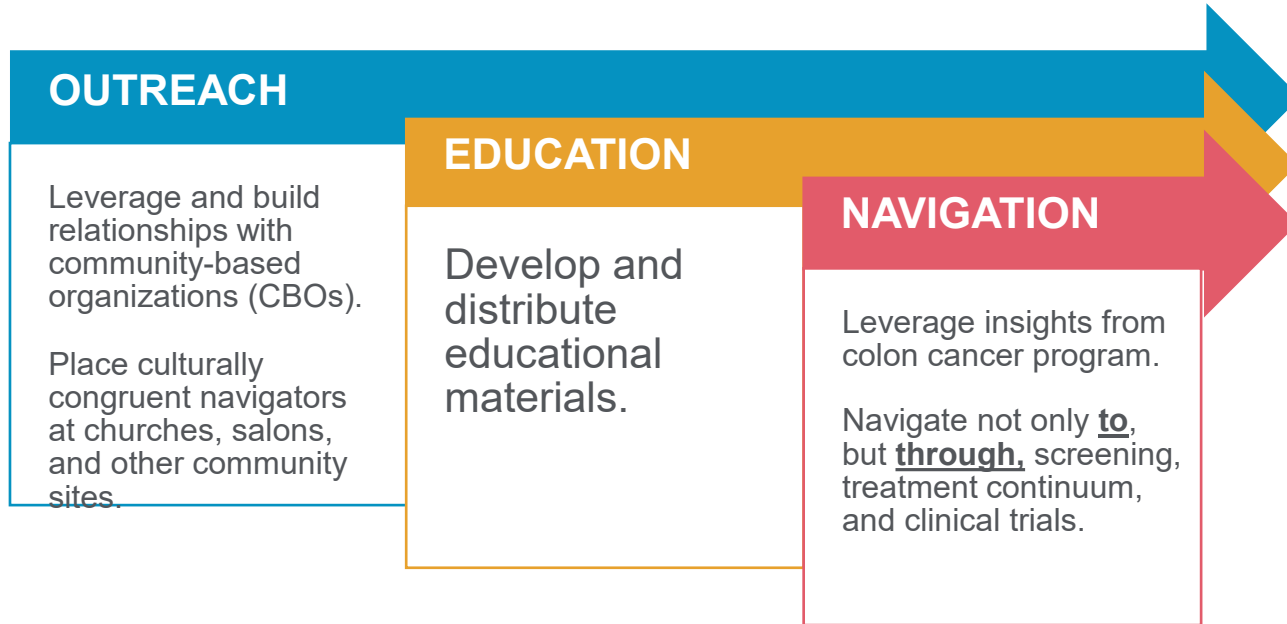

The **Beatrice W. Walters Breast Health Outreach and Navigation Program** brings a vigorous focus on reducing barriers to, and disparities in, excellent screening and care for medically underserved women. The program also assists women in navigating the healthcare system through **one-on-one guidance** and **direct interaction**.

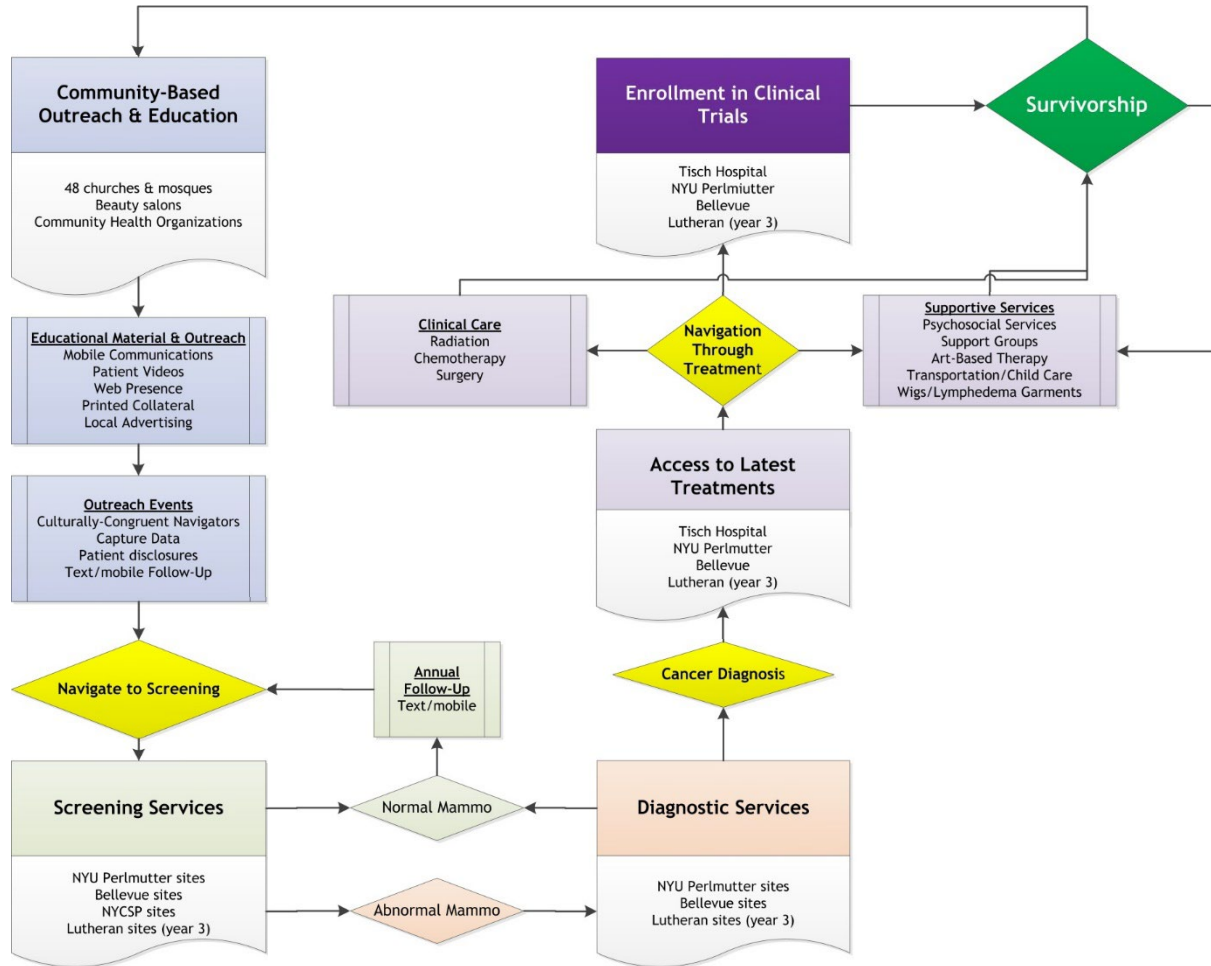

Through the **Walters Program**, patient navigators identify women who could benefit from breast cancer screening through outreach and educational programs in community venues that women routinely visit. Our patient navigators also help women secure breast health services, such as free or low cost mammograms, and provide them with active support, from diagnosis and treatment to survivorship.

This program aims to be a model for other cities to follow to improve outcomes in breast and other types of cancer.

Achieving the Mission

FLOW CHART

NYULMC CANCER PREVENTION NAVIGATION PROGRAM

- \$4,050,000 grant awarded from the NYC Department of Health and Mental Health
- Allows expansion of Beatrice W. Welters Breast Cancer Program
- 7 additional patient navigators
- Outreach and navigation in beauty salons, barbershops and faith-based organizations
- Clinic-based navigation at six primary care sites, including NYU Brooklyn

Geographic Reach

-  Health Fair/Community Event
-  Church
-  Social Service Organization
-  Senior Center
-  Healthcare facility

Comprehensive Overview and Impact

Year Two Tailored Materials

Who should be screened for breast cancer? 誰應該接受乳房癌篩檢?

- Women ages 20 to 39 should have clinical breast exams at least once every three years.
- Women ages 40 to 69 should have mammograms every year.
- Women ages 70 and older should continue to have mammograms every year as long as they are healthy.

• 年齡介於 20 到 39 歲之間的女性，至少應每三年接受一次臨床乳房檢查。
• 年齡介於 40 到 69 歲之間的女性，每年應接受一次乳房攝影檢查。
• 年齡 70 歲以上的女性，只要身體仍健康，每年應接受一次乳房攝影檢查。

How can I become involved with the Welters Program? 如何加入 Welters 計畫?

To participate in a breast cancer screening, learn more about the Welters Program, or host a presentation by our patient navigators, please call Anita McFarlane at 844-908-9396 (844-902-9395) or email the Welters Program team at beta@nyulangone.com.

若要參加乳房癌篩檢，或加入 Welters 計畫，或邀請我們的患者導航人員到貴機構演講，請打 844-908-9396 (844-902-9395) 或 Anita McFarlane 聯繫，或傳電子郵件與 Welters 計畫團隊，地址：beta@nyulangone.com。

Breast Cancer can Impact any Woman. 乳癌可能會影響到任何一位女性。

That's why every woman - regardless of her race, ethnicity, religious and cultural background, income or insurance status - should have access to quality care. 因此，不論種族、族裔、宗教和文化背景、收入或保險身分，每一位女性都應享有優質的醫療服務。

PERLMUTTER CANCER CENTER Beatrice W. Welters Breast Health Outreach and Navigation Program Beatrice W. Welters 乳房健康外展與指導計畫

乳癌女性佔總數的約 30%，但最近，曾經沒有接受過乳房癌的女性將佔三分之一，許多沒有任何風險因素的女性仍佔了乳癌。

華裔女性罹患乳癌的機率低於其他種族的女性，但這些人接受篩檢的機率持續偏低。研究顯示，華裔婦女的篩檢率仍低於在北美洲接受乳房攝影檢查的女性。此外，華裔女性接受乳房攝影檢查的年齡比非裔女性晚。

What are some of the risk factors for breast cancer? 乳癌有哪些風險因子?

- Although it's important to remember that many women who develop breast cancer have no known risk factors, you may be at greater risk if you:
 - Are a woman age 45 or older; however, average age at breast cancer onset is approximately 50 years earlier among Chinese women as compared with Western women
 - Have a family history of breast cancer or specific inherited genetic mutations, such as BRCA
 - Are overweight or consume alcohol
 - Received a previous breast cancer diagnosis or abnormal cell growth in the breast (lobular carcinoma in situ (LCIS, atypical ductal hyperplasia) or underwent previous radiation therapy
 - Experienced your first period before 12 years old, had a late pregnancy (age 30 or older), have never been pregnant, late menopause, or used hormone replacement therapy during menopause

雖然要牢記一點，許多沒有已知風險因子的女性仍罹患了乳癌。值得注意的是，若您的四位一輩裔，曾罹患過乳癌或基因檢測陽性。
• 是 45 歲以上的女性，不過，相較於西方女性，華裔女性乳癌發作的平均年齡較晚。
• 有乳癌或特異性遺傳基因變異 (例如 BRCA) 的家族病史。
• 體量過重，或經常飲酒。
• 過去曾接受過乳房癌治療，或是有非正常的細胞生長情形 (例如原位癌 LCIS、非典型性腺泡增生)。
• 初經年齡於 12 歲前，遲經或閉經等。CIC 或晚經大，從未懷孕，晚停經，或是停經後曾服用過激素替代療法。

Who is Beatrice W. Welters?

Diagnosed and treated for breast cancer at NYU Langone Health's Perlmutter Cancer Center, patient navigator and former U.S. Ambassador Beatrice W. Welters recognized an opportunity to expand access to screening, diagnosis, and treatment for communities throughout New York City. To achieve this goal, she partnered with Perlmutter Cancer Center to launch the Welters Program in the fall of 2016.

PERLMUTTER CANCER CENTER Beatrice W. Welters Breast Health Outreach and Navigation Program

Beatrice W. Welters Breast Health Outreach and Navigation Program
844-908-9396 | beta@nyulangone.com

Expanding access to breast cancer screening and care across New York City

and Navigation Program?

The Welters Program helps medically underserved communities in New York City access screening, diagnosis, treatment, and post-treatment services and support by:

- Educating communities about the risks of breast cancer
- Building community partnerships to connect people with screening services
- Guiding those with a breast cancer diagnosis through the latest treatment options with personalized support and assistance

Our patient navigators are central to the Welters Program. Working within their communities, our navigators organize outreach events at places of worship, senior centers, community-based organizations and businesses etc. to provide breast health information and encouragement to get screened and treated, if necessary.

What should you know about breast cancer?

Breast cancer is the most common cancer among all women. Trans women on hormone therapy and trans men who have not had a bilateral mastectomy, according to nearly one in three cancer diagnosed in the group of people. Many people who develop breast cancer have no risk factors. Hispanic/Latina cis women, trans women on hormone therapy and trans men who have not had a bilateral mastectomy, have lower rates and risk of death from breast cancer compared to non-Hispanic African American/Black and Caucasian. However, breast cancer is the most common cancer - and leading cause of cancer deaths - among the group. They are also more likely than Caucasians to be diagnosed with aggressive breast cancers, which may be due to lower mammography rates and more delays in follow up after an abnormal mammogram.

African American/Black cis women, trans women on hormone therapy and trans men who have not had a bilateral mastectomy, are more likely to die of breast cancer than Caucasians, and are nearly twice as likely to be diagnosed with triple-negative breast cancer, a more aggressive form of breast cancer that is harder to treat. Although African

the year, they are now diagnosed at a rate equal to that of Caucasians.

What are some of the risk factors for breast cancer?

- Although it's important to remember that many people who develop breast cancer have no known risk factors, you may be at greater risk if you:
 - Are a cis woman, trans woman on hormone therapy or trans man who has not had a bilateral mastectomy, age 45 years or older
 - Are a trans woman over the age of 50 who has been using hormone therapy for at least 5 years
 - Have a family history of breast cancer or specific inherited genetic mutations, such as BRCA
 - Are overweight or consume alcohol
 - Received a previous breast cancer diagnosis or abnormal cell growth in the breast (lobular carcinoma in situ (LCIS, atypical ductal hyperplasia) or underwent previous radiation therapy
 - Experienced your first period before 12 years old, had a late pregnancy (age 30 or older), have never been pregnant, or used hormone replacement therapy during menopause.

Who should be screened for breast cancer?

- Cis women and trans men who have not had a bilateral mastectomy age:
 - 20 to 39 should have clinical breast exams at least once every three years.
 - 40-69 should have mammograms every year.
 - 70 and older should continue to have mammograms every year as long as they are healthy.
- Trans women over the age of 50 who have been using hormone therapy for at least 5 years.
- *Even testosterone use may be converted to estrogen. Trans men taking testosterone may be at increased risk for breast cancer.

Refined Barriers to Screening Assessment

Updated barriers assessment based on *HealthLeads Social Needs Screening Toolkit*

Captures social determinants of health across fourteen domains

Domains:

- Financial resource strain
- Food insecurity
- Housing instability
- Utility needs
- Dependent care
- Transportation challenges
- Exposure to violence
- Education/health literacy
- Physical comorbidity
- Social isolation & support
- Immigration status

NYU Langone Health

Designed a new data management system

The dashboard, titled "NYU Navigator Outreach Dashboard", displays "Outreach Programs: Walters, Beyond Bridges & LGBTQ+". It features a central "Patient Navigation Map - Unique Patient Count" showing a map of New York State with counties shaded in blue and labeled with patient counts. A sidebar on the left contains filter options for Start Date, End Date, Navigator, Department, Encounter Type, Program, Payor Name, Cancer Type, and County. Below these are "SOGI/REAL Demographic Filters" for Sexual Orientation, Gender Identity, First Race, and Ethnicity. A top navigation bar includes buttons for "Encounters Summary", "Demographics (SOGI ...)", "Patient Location", "Service Tracker Proced...", and "Barriers". A "Layout" panel on the far left allows for adjusting the dashboard's appearance, including position, size, border, background, and padding.

- Integration of patient navigators into clinical trial education

SAFETY NET HOSPITALS-GENETIC TESTING

Despite NCCN guidelines for genetic testing, studies have found that fewer than 30% of African Americans and Hispanics were aware of genetic testing for cancer risk assessment and have detected high rates of misperception regarding its use. These findings are alarming given that 22% of AA women who are diagnosed with invasive cancer and have a family history of tumor features associated with germline mutations ultimately test positive for a deleterious mutation.

SAFETY NET HOSPITALS-GENETIC TESTING

Genetic testing rates strongly correlate with discussion of genetic testing by providers

Economic factors are also implicated in reduced genetic testing

There are financial assistance programs available that can help patients overcome these economic barriers

SAFETY NET HOSPITALS- RECONSTRUCTION

Postmastectomy breast reconstruction rates examined at Bellevue Hospital, a large city hospital in New York City

77.7% of the population studied received Medicaid, majority non-White population

73.6% of the patient population received postmastectomy breast reconstruction

Hispanic (89.1%) and Black women (80%) were most likely to receive reconstruction

33% received autologous reconstruction

Breast Reconstruction in an Underserved Population: A Retrospective Study

Maxime M. Wang, BA, Elizabeth Warnack, MD, and Kathie-Ann Joseph, MD, MPH
Department of Surgery, New York University School of Medicine, New York, NY

ABSTRACT

Background. Breast reconstruction can help restore the shape and appearance of breasts after surgery. Studies have shown that minority and uninsured patients are less likely to receive breast reconstruction after mastectomy.

Objective. We sought to determine if post-mastectomy reconstruction varied by patient ethnicity and insurance status in a medically underserved population.

Methods. This was a retrospective study of mastectomy patients seen at Bellevue Hospital Center, a safety-net hospital in New York City, between January 2010 and December 2015. The Chi square test was used to compare patient characteristics versus type of reconstruction chosen and likelihood of reconstruction. Logistic regression was used to examine likelihood of reconstruction, controlling for patient insurance status, race, age, stage at presentation, and contralateral prophylactic mastectomy.

Results. Of the 750 patients included in the database, 220 underwent mastectomy. Overall, 73.6% of our patient population received breast reconstruction. Patients with Medicare insurance were less likely to get reconstruction compared with patients with other types of insurance (37.5%, $p = 0.04$). Hispanic patients were most likely to receive reconstruction (89.1%), followed by Black patients (80%) and Asian patients (66.7%) [$p = 0.03$]. There were no significant associations between patient race or stage at presentation and type of reconstruction. In a multivariate logistic regression, advancing age was associated with a decreased likelihood of reconstruction (adjusted odds ratio 0.91, $p < 0.001$).

Conclusions. In our underserved patient population, patients received breast reconstruction at rates higher than the national average. Institutional availability of patient navigators and preoperative counseling may contribute to more equal access to breast reconstruction.

INTRODUCTION

Disparities in health care have been demonstrated for minority and underserved patients in a variety of healthcare fields.^{1–4} Low socioeconomic status is associated with fewer immunizations, fewer screening tests for cancer, and lower-quality hospital care.⁵ Disparities in care have also been demonstrated for women with breast cancer. For example, women without private insurance, and minorities, are less likely to have timely mammograms.⁶ Underserved women are also less likely to receive guideline-concordant care after diagnosis.⁶ Disparities in care may translate into poorer outcomes. For example, Hispanic women have a lower incidence of breast cancer compared with White women, yet they have been shown to experience higher mortality rates.⁷

Breast reconstruction can restore the shape and appearance of the breast after mastectomy. The decision for reconstruction is often multifactorial. Greater access to plastic surgeons, greater health literacy, and private insurance status are associated with a greater likelihood of receiving post-mastectomy reconstruction.^{8–11} Evidence suggests that racial and ethnic disparities may exist in the utilization of post-mastectomy reconstruction. Previous studies have suggested that minority patients are less likely to receive post-mastectomy reconstruction compared with White patients.^{12–15} Specifically, several studies suggest that Hispanic patients are less likely than African American patients or White patients to receive reconstruction.^{12,16}

SAFETY NET HOSPITALS-CLINICAL TRIALS

- Only 3% of patients participate in cancer trials in the United States
- Participation rates for African-American patients remains one of the lowest at 1.3%
- Lack of access to clinical trials
- Bias on the part of clinicians and investigators that result in suboptimal enrollment of underrepresented groups
- Expansion of access of clinical trials in safety net access is needed

STRATEGIES FOR IMPROVING BREAST CANCER OUTCOMES

- Improve access to health care
- Flexible hours
- More sites in minority communities
- Assistance with travel, medical costs, child care

WHAT IS A SAFETY-NET HOSPITAL?

- There is no one definition for safety-net hospitals
- Having a universally accepted definition can help ensure funding for hospitals in need

CANCER CARE AT SAFETY-NET HOSPITALS?

- Improve access to cancer screening
- Evidence-based multidisciplinary care
- Patient navigation offering multilingual support to breast cancer patients through the entire continuum of care
- Efforts made at screening as well as cancer treatment
- Expansion of clinical trials at safety net hospitals

Thank you
